QUANTUMFX
DYNAMIC INSTRUCTIONS

The Black Diamond trading system can be utilized across any pairs and any timeframe. Every trader has their own trading style, and will be able to put it into action while using this methodology. If you have never traded forex before, or aren't quite sure what your style is yet then follow the general rules and do not stray from them. As you trade, you will develop your own style and get an intuitive feel for how the market moves, and how it particularly behaves around the indicators utilized in this system.

Installation:
You must unzip the files. Place all the indicators in your MetaTrader 4 Indicators directory. Place the template file named QuantumFX_v1.4.tpl into the Templates folder in your MetaTrader 4 directory. When you open your price chart, click the Templates image icon on the top menu (last one on the right that looks like a price chart) and select Load Template. Then a screen will open and you can select the template you want to load. Select QuantumFX_v1.4.

Indicators used:
MPi-HB
Pivot Points on MultitimeFrame
MadroGoldenFilter (the bottom indicator)
Status Monitor V1.2 (the info indicator on the bottom)
FXSniper LSMA
iParamonWorkTime
PriceChannelStop v1 (cyan or magenta line above or below price)
SignalBars_v6
Clock_v1.2

Rules:
This method has been extremely effective for my firm's corporate trading style as well as my own personal trading on the 15M and 30M charts. However, you can use this method on any timeframe. Remember, as a general rule of thumb, if you are trading for example the 30M chart, you always want to check the 1H and 4H charts and identify the longer term trend. Do not take signal on the 30M chart against the longer term trend in order to minimize drawdown and increase consistency.

Buy Trades:
1). Blue arrow up on the Madro Golden Filter Indicator at the bottom (it only shows after the close of the candle)
2). Minimum of (3) indicators of the Madro Golden Filter must be blue (best if four for confirmation of entry). If one of these four (arrow, little cross, little square, and "x" square) is red, then there is NO entry.
3). The actual candle must be GREEN
4). FXSniper LSMA must be green.
5). PriceChannelStop v1 must be cyan color and below the candlestick.
6). Use the Fibonacci retracement and pivot lines for more judgment. If you are not familiar with pivot points, then I suggest you read the additional pivot points summary information included in this package as a complimentary so that you can use discretion regarding scenarios of buy signals being created in combination with price's proximity to pivot areas.

Sell Trades:
1). Red arrow down on the Madro Golden Filter
2). Minimum of (3) indicators of the Madro Golden Filter must be red. If any are blue, then NO Entry.
3). The actual candle must be RED
4). FXSniper_LSMA should be red.
5). PriceChannelStop v1 must be magenta color and above the candlestick.
6). Use fibonnaci and pivot lines as mentioned above.

Stop Loss:

There are many different ways you can use the SL, depending on your personal taste. There are no fixed rules with this system.

One method to use is to set the SL below the low of the last 3-4 candles, but not more than 25-30 pips for the slow pairs such as (EUR/USD) and 35-40 pips for the volatile pairs (GBP/USD, EUR/JPY, etc.)

TP & Exits:

The safest TP is the next Pivot Line minus the spread (example: entry long close to Pivot = Target at R1 line – spread)

Exit as soon as either noe of any of the indicators begins to change color. Also, you may want to move your SL to safe position if that happens to try to stay in the trade, or close half your position and ride the trade for more profit. This is all based on your personal tastes.

Additional Hints:

If you load the template file from the attachment on your chart, all values for the indicators should already be on your chart. There is no need to change anything. Although, you can experiment of course if you want to.

Don't trade too many pairs. Concentrate on 2-4 pairs. Every pair has its characteristics and after a while you start to know how they behave. I *hate* USD/CAD for example, based on how it moves.

The status bar at the bottom is nice to know the spread with the dollar value for each pip, and the swap for it in case you want to carry over trade for next day.
