## Scalper\_AvtomatFX

**Terminal:** MetaTrader4

**Expert Advisor type:** intraday scalper

**Timeframe:** M1, M5 **Recommended trading**

**pairs:** EURUSD, GBPUSD, AUDUSD, NZDJPY, AUDJPY, USDCHF **Additional trading pairs:**

EURCHF NZDUSD USDCAD USDJPY GBPCHF EURGBP

GBPAUD GBPCAD GBPJPY GBPNZD EURJPY EURNZD

**Estimated return:** - **Conservatively** 20-30% per month -

**Aggressively** up to 100% per month - **Overclocking** to 300% per month

Hello dear trader! We, the AvtomatFX team, sincerely congratulate you on the acquisition of one of our best developments - the Scalper\_AvtomatFX robot. This robot is the result of several months of hard work and several more months of optimizations and fine-tuning of settings. As a result, we are proud to provide it to you.

And before we start, we want to remind you once again that trading on the forex market is a high-risk activity, no one is immune from losses. It is very important to be aware of this and not to trade on borrowed or necessary funds for life. Also, since the robot is a scalper (a robot that profits from small market movements), it requires constant monitoring during its active work. Unfortunately, some of our clients neglect this aspect and hope that the robot will do everything for them. But robots of this type will never be able to work fully automatically, which completely cuts off the possibility of a favorable outcome if the robot is left unattended. If you do not have the ability to control the operation of this robot, then we recommend that you consider options for longer-term robots from our arsenal, or, as a last resort, trade only on days when you can control its operation. In this manual, we will try to talk about the main settings and strategies for working with this robot, touch on the nuances of robot trading, try to explain as simply as possible how to make the adviser trade only in plus 95% of the time and explain how to act if the robot has entered a drawdown . So let's go.

**ATTENTION!** In the process of creating the adviser, many trading methods were used, which ultimately did not lead to an improvement in the result and in the final version of the robot were disabled as unnecessary, but we still left some parameters set to changeable values for those clients who want to perform additional optimizations and try to improve the trading settings. This methodological guide will consider only those parameters that really affect today's robot trading, parameters that need to be understood for what they serve. If any of the parameters (or buttons on the info panel) is not considered in this manual, then by default we consider it unnecessary for successful robot trading. Also, in the case of optimization by such parameters, there is no need to understand what this value is specifically responsible for; when performing optimization, it is only important to see the dynamics of the change in the final result when the value of this parameter changes.

## Chapter 1. General description of the Scalper\_AvtomatFX Expert Advisor and its settings

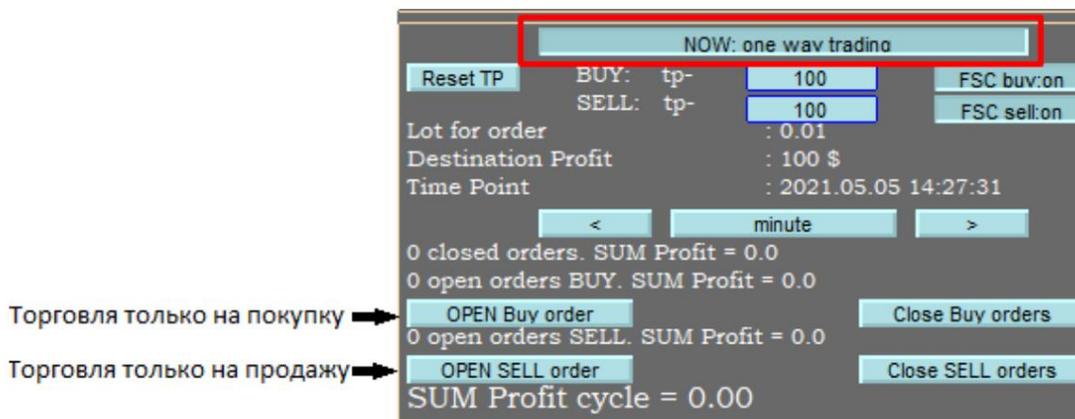

With the correct installation of the adviser, the adviser's information panel should be displayed on the chart on the right, with the help of which, in most cases, we will further interact with the adviser. Below in this chapter, we will try to explain as clearly as possible what each element of this info panel and each value in the list of EA settings means.

The Scalper\_AvtomatFX Expert Advisor has **2 trading modes**: - **Fully automatic**, in which cycles open at the time set in the settings and close when the profit specified in the settings is reached - **Semi-automatic**, in which the cycle is opened by the trader independently upon the output of a signal from additional indicators-signalers. Closing in this case occurs in the same way as in the first option upon reaching the profit set in the EA settings.

Switching between trading modes is done by pressing the big button in the middle of the info panel:

In the screenshot above, the trading mode is set in 2 directions (both for buying and for selling). In this mode, the EA is allowed to trade on its own in a **fully automatic mode** at the time set for this. You can also start the trading cycle in two directions manually by clicking on the button in the upper right corner of the info panel - **"Open first order"**. This can be useful if you have the skills or additional indicators to determine lateral movements (sideways movement in relation to this robot means a movement of 30-40 candles on the M5 timeframe with a price movement range of 10-20 points), in this In this case, an additional trading cycle can be launched in 2 directions without additional signals from the Scalper\_AvtomatFX Expert Advisor or its add-on indicators. To switch to trading in **semi-automatic mode**, you need to click on the button indicated above and in this case the inscription NOW: one way trading will appear. In this case, the adviser can **ONLY** trade in one direction - either only to sell, or only to buy. In this mode, 2-way trading is not possible, so the EA will not open trades automatically, only manual opening of cycles is possible by clicking on the appropriate button - OPEN Buy order or OPEN Sell order (see screenshot below).

To date, **the fully automatic trading mode** is used by our clients on only one pair that has proven itself the best - this is GBPUSD. For this trading method, we specify in the settings a time "window" when the EA is allowed to open cycles on its own. By default, the presets provided to the Expert Advisor set the allowed time for automatic opening of cycles from 7:00 to 10:00. But since during this time several cycles sometimes manage to open, this does not always suit some customers, so they reduce this interval to 8-9 in the morning, which gives time for only one automatic cycle to open and work. Some customers, on the contrary, try to give the robot as much time as possible for automatic work, up to 24 hours a day. Let us immediately indicate that the option with a fully automatic operation of the adviser 24 hours a day is considered to be overclocking and, as a result, very high-risk. This type of work should be used very carefully. Please note that the time specified in the settings does not mean that all transactions will be opened and closed in this interval. This interval is exactly FOR OPENING new cycles. Closing can also be made after this time period.

**The semi-automatic type of trading** is used on all 6 pairs indicated at the beginning of the manual (or on 18 pairs, if you are ready to take risks). Entry points in semi-automatic trading can be searched as follows:

1. Using your own strategies and indicators, relying on the free author's **DailyRange indicator**, which comes in the package with the Scalper\_AvtomatFX robot. This indicator shows us 4 levels for each day, from which a rebound is possible. 2 levels are closer to the price, they are less firm, 2 levels further away are stronger. If there are additional methods/indicators for determining a price reversal, you can use this indicator as a starting point for determining a specific place to enter a one-sided trading cycle. The main idea is based on the fact that in 95% of cases the price returns inside the channel boundaries. But when this does not happen, you need to fix the loss, we will talk about this below. The appearance of the indicator is shown below:

2. If you do not have such strategies/methods/indicators for determining price reversal points, then for this case we have additionally developed a **signal indicator** that will show a specific entry point for a semi-automatic trading cycle. It looks like this:

Red arrows show signals to enter a sell cycle, blue arrows show signals to enter a buy cycle. The **version 2.0** signal indicator uses a link to the DailyRange channel, signals appear either close to the border of the indicator inside the DailyRange channel, or behind its first level and further from the center of the channel, in other words, while the price is trading approximately in the middle of the DailyRange channel, then signals from the signal indicator will not exit, which will not give rise to false entries. On the other hand, if the price is trading in the middle of the channel sideways, then here we can turn to the 2-way trading, which was already discussed above, in order to open 2-way cycles. It is important to make sure that the price is really in a sideways movement with the help of the methods in your arsenal.

3. Signal indicator version 2.0 gives a lot of signals, among them both very reliable signals that go beyond the second border of the DailyRange indicator, and not the strongest ones, which later will have to be closed at a small loss. For this reason, we have improved the indicator and released **version 3.0**, which defines fewer entry points, but their quality is much higher. For this indicator, the arrows on

Selling is indicated in purple, Buying in green. An example of how it looks in the chart below:

If we compare the signal indicators of version 2.0 and 3.0, then we cannot unequivocally say that 2.0 is worse, because often where indicator 3.0 does not give a signal due to the absence of strong confirming factors, indicator 2.0 will give a signal, and maybe not one, which will close with a profit. Therefore, you need to decide for yourself whether you are ready to risk more and take more from the market, respectively, or whether you are a more conservative trader who cares about the quality of transactions, and not their quantity, in other words, less profit with less risk. Here are examples of the work of the signalman version 3.0: <https://t.me/avtomatfx/2965> <https://t.me/avtomatfx/3201> 4. Every day our trader gives several free signals in our telegram channel t.me/avtomatfx for one-way trading. You can use them. These signals are duplicated from our private channel, where all signals from the Signaler indicator go and where we add everyone who has purchased these indicators. The essence of this channel is that you always receive a notification about the signal output in telegrams, which gives you the opportunity not to miss a single signal. Even if you are not at your computer, you can remotely log in from your phone to your VPS or computer and open a trading cycle.

As for the direct purchase of indicators-signalers - both indicators are not provided in the standard package for the Scalper\_AvtomatFX robot, you can purchase them by making a request from our telegram manager @RuslanAvtomatFX. When purchasing two indicators at once, we provide an additional discount. It is also possible to purchase indicators for free, check with the manager in telegram for details.

Things to consider when working with semi-automatic cycles: - If a trading cycle is opened for one pair and you receive another signal, for example, from the Signaler indicator, then you do not need to enter the cycle again, just wait until the current cycle is closed and only after we can open the next one. Technically, you won't even be able to open 2 cycles on one chart, but knowledgeable traders will figure out how to do it. But again, we don't do that.

- You need to understand that if there is a drawdown in current cycles, the subsequent opening of cycles can lead to additional risks. Therefore, soberly assess the size of the deposit and your endurance when a drawdown appears on your account. If you feel uncomfortable, then it may be worth not rushing to open new cycles, even when new signals appear. Or vary the risks for new cycles. How to do this will be described below.

That's all about the advisor's trading modes.

The EA implements an algorithm for opening orders based on the analysis of the tick flow of Ask and Bid price values. The adviser works best when the price moves in a range, which immediately indicates that the methods for determining lateral movements from your personal arsenal will be a good additional help in trading with this adviser.

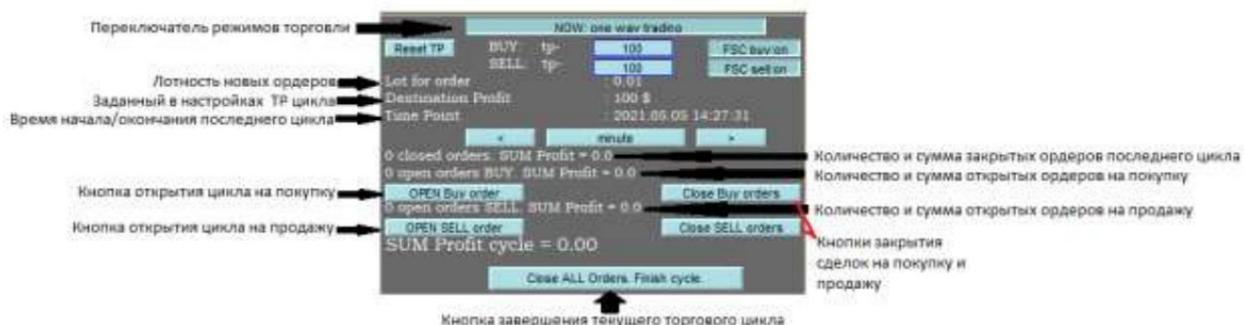

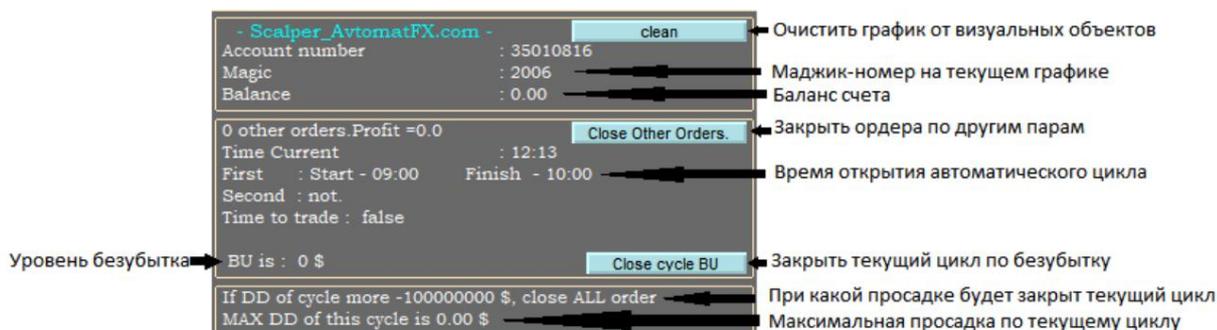

During operation, the EA opens a large number of orders with a small lot size, which can be closed at a predetermined take profit during the cycle. In order for the loss from the remaining orders not to cover the profit received, the Expert Advisor uses the "Earnings in the time interval" algorithm.

The essence of this

algorithm: 1. The EA puts a timestamp on the chart of the traded pair, on the info panel this value is displayed as Time\_Point, this is the time when the last trading cycle for the pair was started/ closed. 2. The EA calculates the profit from each order closed after this time. 3. Each tick the EA calculates the profit/loss from each open order 4. The EA analyzes the amount of profit from closed orders in our time interval after the start of the cycle and the profit/loss from open orders. And when the total value is equal to or exceeds the set take profit in money, the adviser closes all open orders and sets Time\_Point to the closing time of the entire cycle, thus indicating a new time interval.

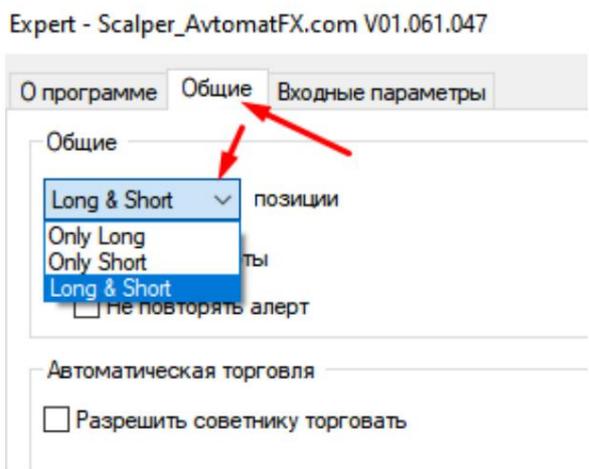

For convenience, the information panel displays the SUM Profit Cycle value, which is equal to the sum of profit / loss of all closed and open orders for the current cycle. As soon as this value is greater than Destination Profit (the take profit value set in the EA settings for the overall cycle), then all open orders will be closed and the cycle will be completed.

**Below is a schematic description of the main buttons and information from the info panel**

Since the robot opens many deals and their trackers remain on the chart during their work, the "Clean" button was added to the info panel. When it is pressed, all graphical objects that can interfere with the analysis of the chart and, in some cases, slow down the operation of the terminal will be automatically removed from the chart. When you click on the "Close Other Orders" button, the robot will close all orders that are on account, except for those who are on the chart on which you click this button.

If you determine that it is not possible to close the cycle with a profit, then it is possible to indicate to the robot that the cycle must be closed at breakeven. To do this, click on the “**Close cycle BU**” button and when the profit specified in the settings as breakeven is reached (by default, this value is 0 and it is displayed to the left of the “**Close Cycle BU**” button), the robot will complete the trading cycle. The buttons “**Close Buy orders**” and “**Close sell orders**” close the corresponding transactions in the current cycle (it does not matter one-sided or two-sided). But with this, the cycle does not end, i.e. after the closing of transactions, the robot will continue to work until the specified profit is reached. These buttons will be useful mainly when working with a two-way trading cycle in case you have determined that one-way trades will no longer be profitable and you want to close them. After that, you need to go to the adviser settings and in the “General” tab change the traded positions only to those that you want to keep

At the end of such a cycle, do not forget to return this value to the original "Long & Short". In order to manually complete the cycle, you need to click the “Close all orders”.

Finish cycle. In this case, the robot will completely close all transactions and will wait for the next entry into the trading cycle.

### Description of robot settings Scalper\_AutomatFX

ab	Comment for SET	M5 EURUSD
123	magic	2006
123	Dynamic lot	false
ab	---	-- For static lot --
123	Lot	0.01
123	TP main (\$)	100
123	If DD of cycle more "\$" close ALL order	100000000

**Dynamic lot – true** – the lot size will be calculated based on the size of the deposit, i.e. grow with profit.  
**False** - the lot size will not change with the increase in the deposit. By default, we use only constant lotness when working with this robot, but we left this option for experimenters.

**Lot** – lot size of each order with disabled dynamic lot size.

**TP main (\$)** – profit level in money at which the trading cycle will be closed automatically.

**If DD of cycle more "\$" close ALL order** - a parameter that sets the maximum drawdown in monetary terms. In other words, when a drawdown of this amount is reached, the current cycle will be closed. As a rule, we do not use this parameter, so it is set to a very large number. But if you need it to be set, then change the value to the actual one for you. We will return to the question of the value of the maximum drawdown for the cycle below.

ab ---	-- For dynamic lot --
1/2 Lot for every 1000\$ depo	0.005
123 TP main (\$) for every 1000\$ depo	50
123 If DD of cycle more "(\$ for every 1000\$ depo" close ALL order	250

These settings are relevant **ONLY** if you have a dynamic lot enabled for orders.

**Lot for every 1000 \$ depo** - indicates the value of the lot for each 1000 currency units accounts. For example, if you have a deposit of 10,000 cents, then with the current settings, as in the screenshot, the lot size for each order will be  $10,000/1,000*0.005=0.05$  lots.

**TP main (\$) for every \$1000 depo** – take profit in cash calculated for every \$1000 deposit. For example, for a deposit of 10,000 cents with current settings, as in the screenshot, the take profit will be  $10,000/1000*50=500$  cents.

**If DD of cycle more "(\$ for every 1000 depo" close ALL order** – loss level for each 1000 units of the deposit specified in this parameter, the robot will close the entire cycle. For example, with a deposit of 10,000 cents with the value indicated in the screenshot, the maximum drawdown at which the cycle will be automatically closed will be  $10,000/1,000*250=2500$  cents.

ab ---	-----
123 TP for orders (pips)	100
Reset TP after evry cycle	true
123 The maximum number of orders	200
123 Orders one way (% from Orders)	100
123 The maximum number of orders BUY	100000
123 The maximum number of orders SELL	100000
123 Minimum order step (pips)	0

**TP for orders (pips)** – take profit for each order in pips (5-digit quotes).

Reset TP after every cycle - resets the take profit for each order to the standard (100 pips), after each cycle. **We do not use this setting in normal work, we leave it by default.**

**The maximum number of orders** - the maximum number of orders for the cycle.

**Orders one way (% from Orders)** – the maximum number of orders opened one way as a percentage of the maximum total number of possible orders. **We do not use this setting in normal work, we leave it by default.**

**The maximum number of orders BUY** - The maximum number of buy orders. We do not use this setting in normal work, we leave it by default.

**The maximum number of orders SELL** - The maximum number of sell orders. We do not use this setting in normal work, we leave it by default.

**Minimum order step (pips)** – minimum distance in pips between orders.

Turn on filter FSC	true
1/2 Coefficient of slow (if = 0 or Filter FSC = true - turn off)	0.5
Do not trade with other experts	true
Trade only in BUY or SELL	false
Switch on filter indicator Lion	false
123 Period Lion	5
123 Distination for Entry	0
Switch on filter MA	true
123 Period MA	15

**Turn on filter FSC** – enable/disable the author's FSC filter for opening orders. Its inclusion leads to a decrease in open orders. It is recommended to apply on more volatile market segments. **We do not use this setting in normal work, we leave it by default.**

**Coefficient of slow (if = 0 or filter FSC = true - turn off)** - coefficient of slowing down the rate of opening orders. If the value is zero or the FSC filter is running, then the deceleration algorithm is disabled. Due to the peculiarities of the strategy tester, it is not used during the test. **We do not use this setting in normal work, we leave it by default.**

**Do not trade with other experts** - Do not trade with other robots. If this parameter is set to true, the robot will not open trades if the account already has trades opened by other robots, including the Scalper\_AvtomatFX robot, but for a different pair. This parameter is one of the reasons why the robot may not open trades, so if the robot does not trade, check this parameter as one of the solutions to the problem.

**Trade only in BUY or SELL** - trade in one or two directions. Today, this parameter is not relevant, since switching between trading modes is performed on the info panel, so this parameter is left by default.

**Switch on filter indicator Lion** - enable / disable the filter by the author's indicator Leon. **We do not use this setting in normal work, we leave it by default.**

**Period Lion** – period of the author's indicator Lion. **This setting in normal operation do not use, leave by default.**

**Destination for entry** – entry value, editable parameter of the author's indicator Leon. We do not use this setting in normal work, we leave it by default.

**Switch on filter MA** – enable/disable the filter by the author's MA indicator. **We do not use this setting in normal work, we leave it by default.**

**Period MA** – period of the author's MA indicator. **This setting is not normally use, leave by default.**

ab *****	Filter of time work *****	*****
<input checked="" type="checkbox"/>	Switch on time filter	true
ab -----	-----	-- Filter BU -----
123	Time close BU (START interval)	06:00
123	Time close BU (Finish interval)	06:00
123	BU mouney (\$)	0
ab -----	-----	-----
123	Start of trading in Monday	09:00
123	Finish of trading in Monday	10:00
123	Start of trading in Monday	24:00
123	Finish of trading in Monday	24:00

**Switch on time filter** – enable/disable the time filter. Disabling the time filter will cause the EA to trade non-stop. **We do not use this setting in normal work, we leave it by default.**

**Time close BU (Start interval)** – the start time of the interval when the cycle will close at breakeven automatically. **We do not use this setting in normal work, we leave it by default.**

**Time close BU (Finish interval)** – the end time of the interval when the cycle will close at breakeven automatically. **We do not use this setting in normal work, we leave it by default.**

**Start/Finish of trading in Monday/Tuesday/Wednesday...** - start and end time time window for opening automatic trading cycles.

Every day, you can set up trading in two time sections. If the time of the beginning and end of the section coincides, then there will be no opening of orders at this time. If you set each section so that the start and end times will match, then this will give you the opportunity to start trading only in semi-automatic mode, without worrying that the adviser will accidentally open trades automatically if you suddenly do not keep track and leave it enabled for trading at 2 parties during the allowed time window for automatic trading.

## **Chapter 2. Recommendations for using the Scalper\_AvtomatFX robot**

For those who trade with the EA for the first time, we recommend not to rush to work on all 6 recommended pairs, but to start with 2-3 until you get comfortable. In the course of work, we have already come across various examples of working with the Scalper\_AvtomatFX robot, some clients set it to fully automatic trading on one pair and receive a stable 15-20% per month when working with one trading cycle per day. Some clients use several pairs in this way and increase profits up to 30-50%. Most of our clients prefer to vary automatic and semi-automatic trading. There is also a case when deposits doubled in 2 days, in this case trading is carried out non-stop, which implies a very high risk. What can I say - each client decides for himself how he would like to use the robot. Below we will describe the main recommendations and rules that we derived when working with the robot. It is very important to get acquainted with them and only then decide whether to follow them or not. Once again, we want to remind you that this robot shows a very large profit, which also implies high risks. It is important that you understand this and agree that working with this robot entails this risk. If you have a force majeure event, you can write to us without claims and accusations about the current situation of your account, and our traders will be able to comment on the options for getting out of this situation. Also, if you have not yet read "Appeal of the AvtomatFX team to its customers" we strongly recommend

familiarize.

### **Calculation of lot size and take profit of the cycle**

Basically, our clients start trading with a cent account in the amount of 50,000 cents, this is the minimum deposit to get the Scalper\_AvtomatFX robot for free. For this deposit, by default, we use a lot size for each order of 0.25 and a take profit per cycle of 1250 cents. This setting in the form of a preset is provided in the package along with the robot. From here, we can derive a formula so that you can independently change the lot size and profit margin with an increase in the deposit.

The dependency is the following. For every 2000 deposit units: Lot +0.01 Take Profit +50

For example, you have a deposit of 80,000 cents. The standard lot size in this case will be  $80,000/2000 \cdot 0.01 = 0.4$ . Take profit  $80,000/2000 \cdot 50 = 2000$

The type of account in this case does not play a role, we use only the number in the value for the calculation deposit amounts.

### **Basic recommendations when trading with the Scalper\_AvtomatFX robot**

1. DO NOT GREED! 2.

With an impulsive approach of the price to the DailyRange levels, we do not enter into a unidirectional trade, we need to let the price consolidate and only if after some time, if the price shows an intention to reverse, we enter a unidirectional cycle. In other words, the screenshot below shows how the price impulsively approached the lower level and broke through it, after which the signalman gave a signal to enter buys. But following this rule, we do not enter until we see that the price has consolidated and then it is clear that such an approach would help us avoid a drawdown.

3. Before important news, we close the cycles that are affected by this news, regardless of the profit or loss on these cycles, and do not trade for another 2 hours after the news release. If you leave these cycles open, then you MAY be lucky and the news will go in your direction and close the cycle with a profit, but on the other hand, you can get a much larger drawdown than it was before the news. Also, if the news did not give any significant movement, then in the following hours they can become a driver for the beginning of a trend or a trend, which, as we wrote earlier, is undesirable when trading with the Scalper. If the news is from the very morning, then it is better to completely turn off the adviser from the evening of the previous day and have a rest that day. We strongly recommend not to test your luck, but the final decision is always yours.
4. We do not tolerate cycles every other day. If the cycle is not closed before 19:00-20:00 Moscow time, close it manually. The longer the cycle is open, the higher the probability that the price will move farther and farther from the levels of opening transactions, therefore, by the evening we try not to open cycles at all, since there is little time left to complete the cycle, and if it turned out that the cycle is not closed until the evening, we close it manually, regardless of the available profit or loss for these cycles. An exception can be made only if there is a strong belief that the price will return the next day. But here you need to be aware that if you make a mistake, then the drawdown will increase.
5. In the event of a drawdown on the account from one cycle at the level of 10-12 take profits, we fix the loss. This value is chosen as an approximate amount of profit for several days. Before closing a losing cycle, be sure to make sure that a reversal is not expected, check if the price may be in the area of a strong level and it makes sense to wait, perhaps the price will not break through it, and also feel free to use your experience to detect reversals. Only after you make sure that the price does not turn around, we fix the loss. The idea is that you will get a profit much more often than a loss, which allows you not to chase profit from time to time, but to leave a part to the market. If you trade correctly from the levels, then the resulting profit will allow you to calmly cover the minus. The main thing is not to be greedy and not get used to the constant daily pluses. Cold-blooded attitude to trade.

### **Other recommendations**

1. By default, in the robot settings, the maximum value of orders in a cycle is 200. But in the process of work, as you gain experience, you can increase this value to 300-400. This is relevant in cases where a reversal is expected at some point, but the robot has already collected the maximum number of orders. In this case, you can manually change the maximum number of orders per cycle. In this case, you reduce the distance that the price will need to return to complete the cycle. But it also increases the risks, so this method must be used wisely.

### **Chapter 3. Additional tools for working with the robot Scalper\_AvtomatFX**

Above, we discussed additional indicators for working with the robot, including the DailyRange range indicator, which is provided free of charge when purchasing the Scalper\_AvtomatFX advisor, as well as paid signaling indicators. Apart from this, there is another additional robot that is included in the robot package for free. This is the Helper\_Scalper AvtomatFX.com Expert Advisor, below we will tell you what it is for and how to work with it.

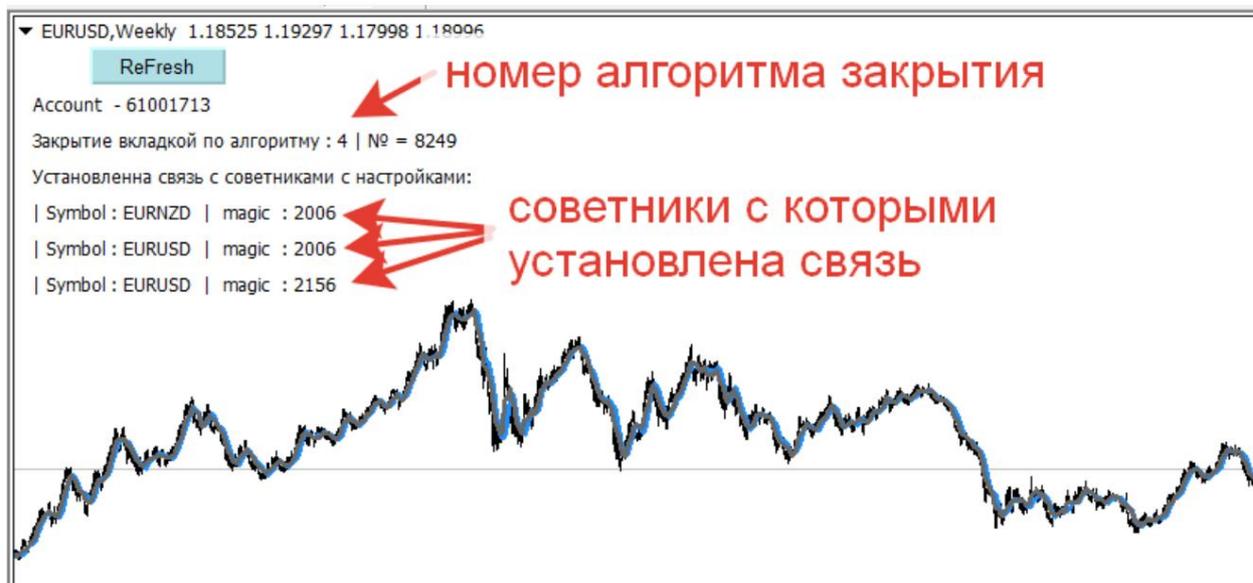

The Scalper\_AvtomatFX Expert Advisor works with a large number of orders. Therefore, he often has to close a large number of orders at the same time, but due to the peculiarities of the MT4 terminal, closing is done one by one and as a result takes a lot of time. Which can lead to eating into profits during the closing of the cycle due to the return of the price.

We have developed an Expert Advisor - Helper\_Scalper AvtomatFX.com, which, on command from Scalper\_AvtomatFX starts parallel closing of orders, which significantly reduces the cycle closing time and, as a result, the probability of eating profits during closing.

The essence of the Helper is to duplicate the closing of trades by the Scalper. Those. at the moment when the Scalper itself starts to close the cycle, the Helper starts doing the same in parallel. As a result, closing occurs conditionally several times faster. Those. if 3 trades were closed per second without Helper, then with 4 additional charts  $5 \cdot 3 = 15$  trades will be closed per second. These are conditional figures for understanding the essence, in reality everything will be a little slower, but much faster than without the Helper.

Installation instructions:

1. In the trading terminal, open an additional four more (you can also one if computer is weak) tabs with any currency pair.
2. Install the Helper\_Scalper AvtomatFX.com Expert Advisor on all these tabs with standard settings, i.e. nothing needs to be changed.
3. Next, the adviser will independently scan the tabs opened in the terminal for the presence of the Scalper\_AvtomatFX adviser on them. And for those pairs on which he finds it, in the future he will help to close deals. To understand what an advisor Helper has established association with tabs Scalper\_AvtomatFX need to look at tabs with Helper'om in the upper left corner. If the Expert Advisors have docked, then there will be a list of pairs for which the connection occurred (see the screenshot below). As a rule, there are no problems with this setting, but if something does not work out, write to the manager in a telegram @RuslanAvtomatFX

### Answers to frequently asked questions about the Helper Expert Advisor:

1. Q: Do I need to put the Helper EA on a specific pair with which I need it contacted?

A: No, it doesn't matter what pair you put the EA on, it will scan absolutely all open charts and contact the Scalper on those on which it is installed. The point of installing Helper on a chart is to allow the terminal to scan open charts, otherwise Helper won't be able to do it. So once again, it doesn't matter which pair to bet on, it doesn't have to be the pair you want the EA to contact. Moreover, it should not be 4 additional charts with Helper for each pair traded by the Scalper. For simplicity, we recommend betting on 4 Eurodollar charts.

2. Q: Is it necessary to put the adviser exactly on 4 pairs?

A: No, you can set up from 1 to 4 charts with Helper, the main thing is that you feel comfortable trading and your computer does not freeze when trading. It will not work to put more than 4 charts, because we programmatically put a ban on the operation of more than 4 versions in the Helper Expert Advisor. This was done because it was found that there is absolutely no difference in whether 4 versions or more work. Up to 4 charts there is a difference, then the adviser only loads the system in vain.

3. Q: Do I need to adjust the settings of the Helper EA?

A: No, you do not need to do anything with the settings, just put on the chart and click "OK"
